FISH CATCHING BY ANGLERS IN SPECIAL
FISHERIES IN CRACOW DISTRICT

Wydział Biologii i Nauk o Ziemi, Uniwersytet Jagielloński

ABSTRACT

The study of fishery questionnaires that reported angling catches in six special reservoir fisheries in Cracow District was carried out in 1990 to assess the angling activity. 3188 cards were analyzed to calculate the angling pressure, intensity and the total weight of fish caught. The species structure of all the reservoirs was also estimated. The quantitative effects of angling were used to assess angling quality of examined fisheries. The basis of assessing the angling attractiveness of the reservoirs was species structure determined in the water bodies.
